Overview: All Working Drawings are saved with the 3D model file. When you create Working Drawings, they will be listed under the *Window* pull-down menu. In order to remove a Working drawing you must be in 2D mode. This solution paper will show you the steps to remove a working drawing from the model.

Solution:

- Open a Model and then click on the *Window* menu. Select any working drawing from the list to open. Select (all) for the layers.
- Click on the **Remove** icon.
- Click on **Drawings** and OK. Select the working drawing you want to remove from the list.

*Note: If you have only one working drawing and you delete it, or deleted the one that was active on the screen, **SolidBuilder** returns you back to Model mode.*
